

Activity 11: Automate Safe Employee Offboarding

Synthetic learning case: Do not upload live employee or candidate data.

Scenario

A synthetic employee is leaving HarbourLight. HR currently coordinates payroll, assets, access, knowledge transfer and exit communication through separate emails, creating missed tasks and security risk.

Learning goal

Design a Copilot Studio offboarding agent and controlled flow that reduces follow-up while preserving separation of duties and respectful communication.

Microsoft tools

- Microsoft Copilot Studio
- Power Automate or agent flows
- Teams
- SharePoint
- HRIS sandbox

Supplied mock data

Use mock-data.csv or the Mock Data sheet in Activity-11-Evidence-Workbook.xlsx. The records are specific to this scenario and carry forward the HarbourLight case.

Guardrails

- Confirmed exit event before action
- Separate HR, payroll, asset and access approvals
- Knowledge and personal data retention are purpose-limited

Detailed procedure

1. Confirm the synthetic exit type, date, obligations and accountable owners.
2. Map employee, manager, HR, payroll, IT, facilities and knowledge-transfer outcomes.
3. Use Copilot to draft respectful, role-appropriate communications.
4. Create agent instructions that disclose status without exposing sensitive reasons.
5. Design deterministic tasks for assets, final pay, access and records.
6. Require authorised confirmation before disabling access or closing obligations.
7. Test cancelled exit, early access removal, missing asset, data leakage and connector failure.
8. Record completion evidence, employee experience and lessons for Activity 12.

Prompt scaffold

You are supporting the HarbourLight Logistics SG training case. Use only the supplied synthetic evidence. Your task is to design a copilot studio offboarding agent and controlled flow that reduces follow-up while preserving separation of duties and respectful communication. State assumptions; cite record IDs or approved source sections; separate observation from inference; flag missing information; list the human checks and approvals required before use.

Evidence checklist

- [] Offboarding journey and RACI
- [] Tool and approval map
- [] Security, privacy and failure test report
- [] Evidence workbook records the input/source, prompt or decision, output, verification, revision and owner.
- [] A peer or trainer can reproduce the reasoning from the saved evidence.

Acceptance criteria

- Confirmed exit event before action
- Separate HR, payroll, asset and access approvals
- Knowledge and personal data retention are purpose-limited
- The output is accurate, traceable, usable and explicit about uncertainty.
- Consequential decisions and actions remain with an authorised human.

Scenario questions

1. What evidence is required before access is removed?
2. Where is separation of duties essential?
3. How can automation preserve dignity during exit?

Submission naming

A11-<YourName>-Evidence.xlsx plus the listed deliverables.

Source anchors

- Course source register: ../../SOURCE-COVERAGE.md
- Microsoft capability boundary: Microsoft 365 Copilot for generative work; Agent Builder or Copilot Studio for agentic work.

Recommended team roles and timing

- HR process owner: confirms that the output solves the stated automate safe employee offboarding outcome and remains consistent with approved policy.
- AI operator or maker: records the exact prompt, instructions, knowledge sources, tool choices and revisions.
- Reviewer or approver: independently checks evidence, permissions, fairness, privacy and any consequential action.
- Evidence recorder: keeps the workbook complete enough for another person to reproduce the reasoning.

Allow about 35-50 minutes for the first build, 15 minutes for testing and verification, and 10 minutes for peer challenge and reflection. The trainer may adjust the timing to fit the delivery mode.

Verification method

1. Compare every factual statement or extracted item with the supplied source record.
2. Mark missing information as unknown; do not convert absence into a negative assumption.
3. Check that personal data, tool access and sharing are limited to the stated purpose.
4. Test one normal case, one ambiguous case, one out-of-scope case and one failure or exception.
5. Ask a peer to challenge the decision, then record whether you accepted or rejected the challenge and why.
6. Confirm the named human owner can correct, stop or reverse the work before submission.

Troubleshooting and recovery

- If Copilot invents evidence, narrow the prompt to named files, tables or record IDs and request citations.
- If an agent answers outside scope, strengthen instructions, remove inappropriate knowledge or tools, and add an explicit escalation response.
- If a flow fails or repeats an action, do not report success. Preserve the error, check the audit record, use a unique request key, and route the case to the human owner.
- If the output is polished but cannot be traced to evidence, treat it as incomplete and rebuild the evidence chain.
