

Lab 10: Use AI for Workforce Wellness Insights

Synthetic learning case: Do not upload live employee or candidate data.

Scenario

HarbourLight has pulse surveys, absence patterns and workload data, but HR spends days combining them. Leaders want early signals without monitoring or diagnosing individuals.

Lab workflow schematic

Learning goal

Use Copilot to analyse aggregated wellness evidence, identify organisational questions and prepare human-led interventions.

Microsoft tools

- Excel with Microsoft 365 Copilot
- Teams
- Word

Supplied mock data

Use mock-data.csv or the Mock Data sheet in Lab-10-Evidence-Workbook.xlsx. The records are specific to this scenario and carry forward the HarbourLight case.

Guardrails

- Aggregate and minimise personal data
- No diagnosis or individual risk scoring
- Employees have a clear human support route

Detailed procedure

1. Review the synthetic aggregated survey, workload and absence tables.
2. Check denominators, missing groups, small samples and data quality.
3. Ask Copilot to identify patterns with cell references and uncertainty.
4. Separate correlation, employee voice and unsupported causal claims.
5. Create organisational hypotheses about workload, support and work design.
6. Draft options such as manager support, process redesign and voluntary resources.
7. Run privacy, stigma, fairness and communication checks.

- Record the human owner, feedback route and measures for evaluating the intervention.

Product workbench

- Sign in with the licensed training account. Use only the supplied synthetic mock-data.csv or evidence workbook; do not paste live HR records.
- Open Lab-10-Evidence-Workbook.xlsx, inspect the Mock Data sheet and record the meaning of team and survey_n before prompting.
- Save a working copy of the workbook in the approved OneDrive or SharePoint training location. In Excel, make the source range a named Table with headers, then open Copilot from the ribbon.
- Ask Copilot to use the named table and cite team for each finding. Request an output table with evidence, uncertainty and an HR reviewer action.
- Compare at least three claims with the original CSV rows. Write corrections and the exact prompt in the Evidence Log; do not treat a Copilot chart or summary as a final decision.

Prompt scaffold

You are supporting the HarbourLight Logistics SG training case. Use only the supplied synthetic evidence. Your task is to use copilot to analyse aggregated wellness evidence, identify organisational questions and prepare human-led interventions. State assumptions; cite record IDs or approved source sections; separate observation from inference; flag missing information; list the human checks and approvals required before use.

Evidence checklist

- ☐ Aggregated wellness dashboard brief
- ☐ Evidence-and-limitation log
- ☐ Human-led intervention proposal
- ☐ Evidence workbook records the input/source, prompt or decision, output, verification, revision and owner.
- ☐ A peer or trainer can reproduce the reasoning from the saved evidence.

Acceptance criteria

- Aggregate and minimise personal data
- No diagnosis or individual risk scoring
- Employees have a clear human support route
- The output is accurate, traceable, usable and explicit about uncertainty.
- Consequential decisions and actions remain with an authorised human.

Scenario questions

- Which attractive insight is not safe to act on?
- How does aggregation reduce but not eliminate privacy risk?
- What response supports people without surveillance?

Submission naming

L10-<YourName>-Evidence.xlsx plus the listed deliverables.

Source anchors

- Course source register: ../SOURCE-COVERAGE.md
- Microsoft capability boundary: Microsoft 365 Copilot for generative work; Agent Builder or Copilot Studio for agentic work.

Recommended team roles and timing

- HR process owner: confirms that the output solves the stated use ai for workforce wellness insights outcome and remains consistent with approved policy.
- AI operator or maker: records the exact prompt, instructions, knowledge sources, tool choices and revisions.
- Reviewer or approver: independently checks evidence, permissions, fairness, privacy and any consequential action.
- Evidence recorder: keeps the workbook complete enough for another person to reproduce the reasoning.

Allow about 35-50 minutes for the first build, 15 minutes for testing and verification, and 10 minutes for peer challenge and reflection. The trainer may adjust the timing to fit the delivery mode.

Test-it evidence

Record test ID, input, expected result, actual result, source citation, reviewer and pass/fail in the evidence workbook. For agent labs, use agent-test-cases.csv and capture the test conversation or run result before marking a case complete.

Verification method

1. Compare every factual statement or extracted item with the supplied source record.
2. Mark missing information as unknown; do not convert absence into a negative assumption.
3. Check that personal data, tool access and sharing are limited to the stated purpose.
4. Test one normal case, one ambiguous case, one out-of-scope case and one failure or exception.
5. Ask a peer to challenge the decision, then record whether you accepted or rejected the challenge and why.
6. Confirm the named human owner can correct, stop or reverse the work before submission.

Troubleshooting and recovery

- If Copilot invents evidence, narrow the prompt to named files, tables or record IDs and request citations.
- If an agent answers outside scope, strengthen instructions, remove inappropriate knowledge or tools, and add an explicit escalation response.
- If a flow fails or repeats an action, do not report success. Preserve the error, check the audit record, use a unique request key, and route the case to the human owner.
- If the output is polished but cannot be traced to evidence, treat it as incomplete and rebuild the evidence chain.
